**Abstract**

The aim of this study is to analyse the knowledge, skills and attitudes parents and teachers have on Information and Communication Technologies (ICT), and the use they make of them. In order to achieve it, a Seminar composed of parents whose children attended primary and secondary schools, together with teachers of different education levels, both from rural and urban areas, has been developed all along an academic year. Group discussions and workshops about using computers and ICT have been carried out so that the participants could be more autonomous and critical in their use. The information was gathered by recording group discussions and writing diaries and later analysed through content analysis. The processes and results from this Seminar have allowed parents and teachers to stimulate partnership, and to develop skills and critical thinking as regards the use of Internet.
